TITLE: Regions of change in the geopotential heights in the basic types of cyclonic high-altitude frontal zones

SOURCE: Tashkent. Sredneaziatskiy nauchno-issledovatel'skiy gidrometeorologicheskiy institut. Trudy\*, no. 15, 1963, 94/104

TOPIC TAGS: meteorology, geopotential, geopotential height, weather forecasting, cyclone, frontal zone, cyclonic frontal zone, atmospheric pressure

ABSTRACT: The author notes that the structure of the baric field at different heights is normally such as to permit the conclusion that this field changes within a very short time interval - on the order of a 24-hour period - with the intensive pressure changes, both at high altitudes as well as at the ground, occurring in the region of high-altitude frontal zones. It is pointed out that the rules of the hydrodynamic theory essentially explain the change in pressure at a given moment, while their use for the purpose of forecasting is based on extrapolation. Attention is called to the importance of the theoretical and empirical relations which make it possible, on the basis of the structure of the height

1/6

Card

ACCESSION NR: AT4012405

field, to estimate the movement of the regions of pressure change and their intensity fluctuations. It is determined that, with movement, the regions of increasing geopotential shift to the left of the contour structure and the regions of decreasing geopotential shift to the right of the contour structure of the initial chart. The more intensive the changes in geopotential, the greater the angle between the direction of the shift of the regions and the direction of the structure contour. There is shown to be a close interrelation between the structure of the high-altitude frontal zones and the geopotential change. On the one hand, the character of the height field is a key to the sign and intensity of the change in pressure; on the other, it is precisely this change in pressure which is the critical factor in the transformation or conversion of basic air currents. An attempt is made in this paper to define more clearly the regions in which a 24-hour shifting of regions of geopotential changes occurs for isobaric surfaces of 500 and 300 mb. Some qualitative characteristics in these regions are represented for the four fundamental types of cyclonic high-altitude frontal zones (see Figure 1 in the Enclosure). Summarizing the effect of all factors in each cyclonic high-altitude frontal zone, the author reaches the following conclusion: Given the situation of a type III cyclonic high-altitude frontal zone the most intensive and extensive (in terms of area) regions of geopotential decrease are generally seen in the forward part of the depression, partially embracing the rear of the depression as well, with weaker regions of increase at the rear of the hollow. With a type IV-cyclonic high-

Card 2/6

ACCESSION NR : AT4012405

altitude frontal zone there will be related intensive and extensive geopotential increase regions in the rear of the extension (depression), occasionally stretching to the forward part of the same as well, while weaker areas of fall-off will be found in the forward part of the trough. In a type I cyclonic zone one may expect regions of geopotential rise and fall of equal and rather great intensity, clearly delineated by the axis of the depression, with the region of decrease certainly in the forward section of the hollow and that of increase - in the rear section of same. In a type II cyclonic high-altitude frontal zone conditions which are weak, but equivalent in force, will be observed for decreasing geopotential in the forward part of the extension, and for increasing geopotential in the rear. These factors determine the changes in geopotential height at a given moment of time. In actual practice, however, the weather forecaster must deal with geopotential changes over a certain elapsed time interval - normally 12 or 24 hours. By the time of the forecast, the regions of geopotential height changes vary their position and intensity, which cannot always be unambiguously foreseen on the basis of the rules of hydrodynamic analysis. For this purpose, an empirical study of the shift patterns of the geopotential change regions was undertaken. In view of the fact isoallohyps are not given on the AT500 and AT300 that charts in the operational service of the Tashkent Weather Bureau, a preliminary computation was made for the geopotential 24-hour change for an overall total of 264 charts for the 1955-1958 period. Over the centers of the geopotential variation regions for elapsed and subsequent 24-hour periods, the author plotted the isohyps curva-

3/6

Card

ACCESSION NR: AT4012405

ture and position with respect to the maximum thickening of the isohyps. The results are given in the form of a set of tables and are found to be in good agreement with the original theoretical premises advanced in the earlier part of the article. Orig. art. has: 1 figure and 5 tables.

TITLE: Ultrapolar air-hollows

SOURCE: Tashkent. Sredneazimatskiy nauchno-issledovatel'skiy gidrometeorologicheskiy institut. Trudy\*, no. 15, 1963, 105-115

TOPIC TAGS: meteorology, air current, atmospheric pressure, weather forecasting, air hollow, ultrapolar hollow

ABSTRACT: An air-hollow with its axis oriented from N. E. to S. W. is called ultrapolar. N. E. flows predominate in the rear of such hollows although, in extreme cases, eastern winds have been observed and the axis of a hollow can even assume a latitudinal direction. The formation of such hollows is due to a sharp reconstruction of the atmospheric circulation and its deviation from the norm. This anomaly has considerable significance in the prognosis of pressure fields at high altitudes and consequently of weather. The depth of a hollow influences the degree of development of wave activity over Central Asia. When the

TITLE: Aerosynoptic characteristics of the abnormally cold July of 1960 in Central Asia

SOURCE: Tashkent. Sredneaziat'skiy nauchno-issledovatel'skiy gidrometeorologicheskii institut. Trudy\*, no. 15, 1963, 122-127

TOPIC TAGS: meteorology, air temperature, troposphere, tropospheric cold, tropopause, double tropopause, air-hollow

ABSTRACT: July is usually the hottest month in Central Asia, but in July 1960 most of the Uzbekistan meteorological stations recorded below normal average monthly temperatures. For the second and third 10-day periods, the average daily temperature was 2-6 C lower than the norm, close to the record. The cold period lasted 30 days, including the first 10 days of August. To determine the vertical distribution of the anomaly, the average temperature and its deviation from the norm were calculated. The sign of the monthly anomaly at most of the stations remained the same up to an altitude of 100 mb, and the absolute value of the deviation for 50% of the stations was maximal at 100 mb. The following general trend was

Card 1/3

ACCESSION NR: AT4012408

noted: up to 700 mb the negative anomaly increased; above 700 mb and up to 200 mb it diminished; from 200 to 100 mb it increased again. Between 300 and 200 mb, the sign of the anomaly changed at some stations. In the lower layers of the troposphere, the anomaly was more pronounced than at the earth's surface. Usually the fewest types of synoptic situations occur in July - not more than 5 or 6 of the 11 basic types. In July of 1960, only 4 types occurred. There were 13 cold invasions: 4 Western, 2 Northwestern, and 7 Northern which determined the sign of the anomaly. Usually in July, there is a frequent recurrence (56%) of a double tropopause - polar and tropical - covering one another. In July 1960 the double tropopause occurred only 14 out of 31 times, there being an absence of polar tropopauses. The negative anomaly had different origins at various altitudes. In the lower layers of the troposphere, up to 500 mb and above, the deviation was caused by frequent cold invasions. However, the intensity of cooling in connection with the flow of cold air to 500 mb becomes weaker. In southern Central Asia, where lower-tropospheric coolings do not penetrate, positive anomalies of temperature have been recorded. At 200 mb, the negative anomaly is explained by a powerful altitudinal air-bellows, in the rear of which lower-tropospheric cold invasions have occurred, which reaches upward to high altitudes in the lower stratosphere. TITLE: Statistico-stochastic description of synoptic conditions over Central Asia

SOURCE: \*Tashkent. Sredneaziatskiy nauchno-issledovatel'skiy gidrometeorologicheskiy institut, Trudy, no. 20(35), 1985. Voprosy regional'noy sinoptiki Sredney Azii (Problems of regional synoptics of Central Asia), 201-243

TOPIC TAGS: synoptic meteorology, topography, stochastic process, anticyclone, long range weather forecasting, cyclone, Markov process

ABSTRACT: Synoptic conditions were evaluated on the basis of observations obtained in 1944-1962, on baric topography maps, and on a monograph by V. A. Bugayev, et al (1957). The evaluation of the material was made separately for warm and cold half-year periods with four basic synoptic fixed times (0300, 0900, 1500 and 2100 hrs, Moscow time) of day. The conditions of a cold half-year were subdivided into three categories: cyclonic advances from the South, anticyclonic conditions, and weather types. The conditions for a warm half-year were also subdivided into three categories: cyclonic advances, warm and hot (summer) weather type, and cold weather type. The cold half-year data show that 1) the anticyclonic conditions have the greatest probability of recurrence

UDC: 551.609.318

Card 1/2

L 40029-66

ACC NR: AT6015569

(45.8%); 2) processes in the formation of cold half-year weather are subject to change; 3) recurrence of the southern cyclones has a minimum in November; 4) recurrence of cold weather type decreases from November to February and then rapidly increases to its maximum in March; 5) the mean duration of all synoptic (cold half-year) processes is approximately 2 days; 6) advances of the South Caspian and Murgabskiy cyclones are more often replaced by western and, subsequently, northwestern advances; some synoptic processes belong to the forbidden transition type. The evaluation based on warm half-year data show that 1) the cold weather types occupy 55.6% of the whole warm weather period; 2) cyclonic advances from the South occur infrequently (3.4%); 3) recurrence of days with warm or hot weather is 40.4%; 4) western advances are of maximum occurrence (16.6%); 5) thermal depressions appear more often in August; 6) the mean duration of all warm-type processes is 1.5-2 days; 7) transition of weather types can be considered as a Markov double chain. TITLE: Nonlinear properties of a laser amplifier

SOURCE: IVUZ. Radiofizika, v. 8, no. 5, 1965, 899-908

TOPIC TAGS: <sup>21, 44, 55</sup> laser, nonlinear optics, traveling wave laser, laser amplifier

ABSTRACT: Pulse propagation in a traveling wave laser amplifier with a homogeneously broadened line is analyzed using semiclassical methods. The effect of relaxation processes (finite width of the transition line) on deformation of an amplitude-modulated signal in a one-dimensional medium with an inverted population in the presence of nonresonant losses is considered. It is shown that at a certain attenuation  $\delta = \delta_{th} < 2\pi\omega_0 aN$  all input signals at a distance  $Z \gg p(c/\delta)/2N_2 = N_1/N_1 - N_2$ , where  $p > 1$ , become unique steady-state pulses (where  $\omega_0$  is the transition frequency,  $a = (k^2/2\omega_0)T_2$ ,  $k^2 = 2\mu/\hbar^2$ ,  $\mu$  is the electric dipole moment of the molecule,  $T$  is the relaxation time,  $N = \hbar\omega_0 N$  is the energy of a unit volume of the medium,  $c$  is the velocity of light on the medium, and indexes 1 and 2 refer to the lowest two of the three levels in the system). The power, duration, and the energy of the steady-state pulses were found to be dependent on  $T_2$  and  $\delta$ . At  $\delta_{th} > \delta$  all input signals are damped. A qualitative estimate of the optimal operation of a ruby laser amplifier

TOPIC TAGS: nonlinear optics, two photon laser, laser theory

ABSTRACT: Equations are derived which describe nonstationary processes in a two-photon laser. Conditions for excitation of such a system are derived for a given field  $E_1$ . It was shown that in the case of a metastable second working level, ... field  $E_1$  with a difference frequency  $\omega_1$  may be excited even in the absence of an initial inverse difference in populations, provided field  $E_2$  of an external coherent source is greater by a certain threshold value. The stationary regime and its stability were analyzed. Orig. art. has: 2 figures and 25 formulas.

Partial molar volumes of gases dissolved in liquids (the thermodynamics of dilute solutions of nonelectrolytes). I. R. Krichinskii and A. L'inskaya (Inst. Nitrogen Industry, Moscow). *Acta Physicochim. U.R.S.S.* 20, 327-48 (1945). -- The comparison of values for the partial molar vol. of a gas dissolved in a liquid, detd. exptly. and calcd. on the assumption that Henry's law holds exactly true in the region of finite concns., served as a very sensitive expedient for discovering deviations from Henry's law, even in extremely dil. solns. In this connection the partial molar vols. of  $H_2$ ,  $N_2$ ,  $O_2$ ,  $CO_2$ ,  $Cl_2$ , and  $CO$  dissolved in  $H_2O$  and  $CH_3OH$  were measured by a dilatometric method. The measurements were performed at atm. pressure and at 0°, 25°, and 50°. The difference in values of the partial molar vols., detd. experimentally and calcd. by the equation of Krichersky and Kabanovskiy (C.A. 20, 633) is so great that in no case could it be ascribed to errors in the exptl. detn. (3-4%) or to inaccuracy in calcs. partial molar vols. from the data on soly. To explain the above difference, the concn. dependence of partial molar vols. and heat contents of solvent and solute for dil. binary solns. were analyzed, and by means of

Piunet's method expressions for the fugacity of solvent and solute were derived. An equation was derived for the soly. of a pure poorly sol. gas in a liquid under pressure, explaining the difference in values of the partial molar vols. of dissolved gas, detd. experimentally and calcd. by the equation of K. and K. The empirical character of the latter equation is shown, although this equation expresses very well the data on soly. of gases in liquids under pressure. Analysis of the concn. dependence of the partial molar vols. and heat contents was applied to a three-component system, and expressions were derived for the fugacities of the solvent and two solutes. Equations were given for the simulta. concn. soly. in liquids under pressure of two poorly sol. gases from their mixts. It is also explained why the equation of K. and K. expresses adequately data of the simultaneous soly. in water under pressure at 25° of  $H_2$  and  $N_2$  from a mixt. of them. A diagram of the app. and all references are given. (From P. Stephan)

Determination of small amounts of organic sulfur in gases. A. A. L'IVSKAYA and I. M. KONTSEVOICH. Zhurnal Khim. Fiz. 13, 25-32 (1947) (in Russian). — The method consists in combustion in a furnace in  $SO_2$ , absorption in neutral 3%  $H_2O$ , resulting in solution in  $H_2O$ , and measurement of the color of the color of titration with 0.01 N  $NaOH$ . In gas mixtures with known contents of  $CO_2$  or  $CO$ , results were obtained at a rate of flow of 1 l./hr. and combustion at 700  $^{\circ}C$ ; under these conditions, presence of  $N_2$  in the gas does not interfere, and  $H_2$  oxides are formed. Below 700  $^{\circ}C$  and at too high rates of flow, combustion is incomplete; above 700  $^{\circ}C$  results are high. Good agreement was found with gravimetric data. At lowest  $N_2$  contents, 1 mg. atom, the error is about 10-15%. The combustion takes place and after-sequent operations in 30 min., as against several hrs. required by the gravimetric method.  $N_2$  from Analysis of air contaminated with acetylene.

TITLE: The structure and mechanical properties of vacuum-deposited copper films

SOURCE: Fizika metallov i metallovedeniye, v. 22, no. 5, 1966, 744-751

TOPIC TAGS: copper thin film, vacuum deposited film, film substructure, film mechanical property, thin film, metal film, metal deposition

ABSTRACT: Copper films, 0.5—70  $\mu$  thick, were made by vacuum deposition of 99.95%-pure copper at a rate of 0.5—1.6  $\mu$ /min on copper substrate maintained at 90—250C and their substructure and mechanical properties were investigated by various methods of physical analysis and by mechanical tests. It was found that the film strength, microhardness, and microstresses decreased with increasing temperature of the substrate, while the size of the mosaic blocks increased. The microstresses in the films were significantly higher than the yield strength of solid copper and in a film deposited on the substrate at 90C in a vacuum of  $10^{-4}$  mm Hg reached 60 kg/mm<sup>2</sup>. The film thickness in the 0.5—50  $\mu$  range had little or no effect on the mosaic block size and microstresses. In films 40—50  $\mu$  thick, the

$$I(r, u, \tau, t) = \left\{ \begin{aligned} & \int_{(u_1)} \int_{(u_2)} \sigma(u_1 - u_2) |u_1 - u_2| \times \\ & \times f(r - u(t - \tau), u_1, \tau) / (r - u(t - \tau), u_2, \tau) \times \\ & \times T(u_1, u_2, u) du_1 du_2 - f_0(r - u(t - \tau), u) \times \\ & \times \int_{(u_1)} \sigma(u - u_1) |u - u_1| \times \\ & \times f(r - u(t - \tau), u_1, \tau) du_1 \} \exp \left\{ - \int_{\tau_0}^t \int_{(u_1)} \sigma(u - u_1) |u - u_1| \times \right. \\ & \times f(r - u(t - q), u_1, q) du_1 dq \Big\}, \quad \tau > \tau_0, \\ & \frac{1}{|u_n|} \int_{(u_n < 0)} |u_n| I(r, u', \tau, \tau_0) T(u', u) du', \quad \tau < \tau_0. \end{aligned} \right. \quad (3)$$

$u_n$  is the projection of velocity on the normal to the surface of the body at the considered point;  $\sigma$  is a section of collision;  $T$  and  $\bar{T}$  are probability characteristics of the results of collisions of particles between themselves and with the boundary;  $f_0$  is the initial distribution function;  $F(r) = 0$  is the equation of the surface of the body;  $\tau_0$  is the largest root of the equation  $F(r - u(t - \tau_0)) = 0$ .

**AUTHOR:** Il'inskaya, I. A. 20-119-4-47/60

**TITLE:** Fossile Monotopic and Polytopic Floras and Complexes  
(Iskopayemye monotopnyye i politopnyye flory i komplekсы)

**PERIODICAL:** Doklady Akademii Nauk SSSR, 1958, Vol. 119, Nr 4,  
pp. 797-799 (USSR)

**ABSTRACT:** The variability of the composition of fossil remnants in the range of the investigated volume of a flora-bearing rock is not reflected in previous papers in which the impressions of fossile plants are computed (references 2, 3). On reconstructing the image of a fossile vegetation by means of such computations, the author, as well as other paleobotanists (references 4, 5), were amazed by the variability of the flora composition in one and the same stratigraphic horizon. On the strength of special field works the author came to the conclusion that the fossil floras are not equivalent, i. e. with respect to the extent to which they reflect the vegetation according to the remnants of which they were detected. Most confusing

PHASE I BOOK EXPLOITATION

BOU/5435

Kiselev, P. N., Professor, G. A. Ousterin, and A. I. Strashin, Eds.

Voprosy radiobiologii. t. III: Sbornik trudov, posvyashchenny 60-letiyu so dnya rozhdeniya Professora M. M. Pobedinskogo (Problems in Radiation Biology. v. 3: A Collection of Works Dedicated to the Sixtieth Birthday of Professor M[ikhail] N[ikolayevich] Pobedinskiy [Doctor of Medicine]) Leningrad. Tsentr. n-issl. in-t med. radiologii M-va zdoravookhraneniya SSSR, 1960. 422 p. 1,500 copies printed.

Tech. Ed.: P. S. Peleshuk.

PURPOSE: This collection of articles is intended for radiobiologists.

COVERAGE: The book contains 49 articles dealing with pathogenesis, prophylaxis, and therapy of radiation diseases. Individual articles describe investigations of the biological effects of radiation carried out by workers of the Central Scientific Research Institute for Medical Radiology of the Ministry of Public Health, USSR. [Tsentral'nyy nauchno-issledovatel'skiy institut meditsinskoy radiologii Ministerstva zdoravookhraneniya SSSR] during 1958-59. The following

Card 1/10

807/5435

topics are covered: various aspects of primary effects of radiation; the course of some metabolic processes in animals subjected to ionizing radiation; reactions in irradiated organisms; morphologic changes in radiation disease; and reparation and regeneration of tissues injured by irradiation. Some articles give attention to the effectiveness of experimental medical treatments. No personalities are mentioned. References accompany almost all of the articles.

CH

THE TOXIC PROPERTIES OF ORGANIC THIOCYANATES P. V. Popov and M. I. Minskaya. *Trans. Soc. Ent. Perilists* *Insectophagica* (U.S.S.R.) No. 133, 150-156 (1969); *Khim. Referat. Zhur.* 1969, No. 9, 67. — With *Homocypura* *leucica*, *Aphis pomi*, *Hypoantrax mulsantii* *plumae*, *Calandra oryzae* *brethes* and *Chrysomus leucae* larvae as bioindicators, a high degree of toxicity was found in trimethylene dithiocyanate, propylene dithiocyanate, *p*-thiocyananiline, benzyl thiocyanate, 3-phenylpropyl thiocyanate, 2-phenylethyl thiocyanate and ethylene dithiocyanate. The order of the toxicities coincides with the data of Wilkerson and Hartwell (cf. *C. A. B.* 7(1959)). Introduction of SCN into org. compds., increase of the no. of these groups and increase of the distances between them in the mol. increase the toxic properties of the compds. Aromatic thiocyanate compds. are less toxic than aliphatic. W. R. Heim
